

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the present application:

**Listing of Claims:**

1. (previously presented) A method for providing a connectivity toolkit to a wireless communication device coupled with a connectivity toolkit server via a wireless communication network, the method comprising:

receiving a wireless data connection from a wireless communication device;  
authenticating a user associated with the wireless communication device;  
obtaining profile information for the wireless communication device, the profile information comprising a data storage capacity of the wireless communication device and identification information for a portion of a server hosted data storage area associated with the wireless communication device; and

providing a menu of available connectivity toolkit utilities, wherein the menu is displayed on the wireless communication device.

2. (original) The method of claim 1, further comprising:

receiving a request for a directory listing;  
obtaining a list of files associated with the requesting user; and  
providing the list of files, wherein the list of files is displayed on the wireless communication device.

3. (original) The method of claim 2, wherein the obtaining step further comprises:

querying a file system on the connectivity toolkit server to determine a list of user files; and

identifying a user file associated with the requesting user.

4. (original) The method of claim 1, further comprising:

receiving a request to download a file, the request comprising a file identifier;

obtaining the file size of the requested file;

comparing the file size to a predetermined threshold file size value; and

denying the request to download the file when the file size exceeds the predetermined threshold file size value.

5. (original) The method of claim 1, further comprising:

receiving a request to download a file, the request comprising a file identifier;

obtaining the file size of the requested file; comparing the file size to a predetermined threshold file size value;

approving the request to download the file when the file size is smaller than the predetermined threshold file size value; and

providing the requested file via a wireless communication network.

6. (original) The method of claim 1, further comprising:

receiving a request to upload an identified file, the request comprising a filename and a file size;

comparing the file size to a predetermined threshold file size value;

approving the request to upload the file when the file size is smaller than the predetermined threshold file size value; and  
receiving the identified file via a wireless communication network.

7. (previously presented) A wireless connectivity toolkit system, comprising:

a wireless connectivity toolkit server having a data storage area and a plurality of utility programs, the toolkit server communicatively coupled with a wireless communication network;

a wireless communication device communicatively coupled with the wireless connectivity toolkit server via the wireless communication network, wherein the wireless communication device establishes a session with the wireless connectivity toolkit server over the wireless communication network, the session allowing execution of the utility programs on the wireless connectivity toolkit server and allowing access to a portion of the data storage area reserved for the wireless communication device for uploading and downloading of files.

8. (original) The wireless connectivity toolkit system of claim 7, wherein the plurality of utility programs comprises a file transfer program.

9. (original) The wireless connectivity toolkit system of claim 8, wherein the file transfer program facilitates the transfer of files between the wireless communication device and the wireless connectivity toolkit server.

10. (original) The wireless connectivity toolkit system of claim 7, wherein the data storage area coupled with wireless connectivity server provides data storage for a plurality of wireless communication devices, the data storage accessible to the plurality of wireless communication devices via the wireless communication network.

11. (original) The wireless connectivity toolkit system of claim 10, wherein the network based data storage is provided to a wireless communication device for a fee.

12. (original) The wireless connectivity toolkit system of claim 11, wherein the fee is based on the total amount of data storage in use by the wireless communication device.

13. (original) The wireless connectivity toolkit system of claim 11, wherein the fee is based on the total amount of data storage available for use by the wireless communication device.

14 – 19. (cancelled).

20. (previously presented) The method of claim 1, wherein the profile information further comprises an account status for the wireless communication device.

21. (previously presented) The method of claim 1, wherein the profile information further comprises a communication speed of the wireless communication device.

22. (previously presented) The method of claim 1, wherein the providing step further comprises compressing the menu of available connectivity toolkit utilities, wherein the menu is uncompressed by the wireless communication device prior to being displayed.

23. (previously presented) A wireless connectivity toolkit system, comprising:

a wireless connectivity toolkit server having a data storage area and a plurality of utility programs, the toolkit server communicatively coupled with a first network and a second network, wherein the first network is a wireless communication network and the second network is a public network;

a wireless communication device communicatively coupled with the wireless connectivity toolkit server via the first network, wherein the wireless communication device establishes a session with the wireless connectivity toolkit server over the first network, the session allowing execution of the utility programs and access to a portion of the data storage area reserved for the wireless communication device; and

a network enabled device communicatively coupled with the wireless connectivity toolkit server via the second network, wherein the network enabled device establishes a session with the wireless connectivity toolkit server over the second network, the session allowing access to a portion of the data storage area reserved for the wireless communication device.

24. (previously presented) A method for managing data on a wireless communication device coupled with a connectivity toolkit server via a wireless communication network, the method comprising:

providing a connectivity toolkit server having a data storage area and a plurality of utility programs, the connectivity toolkit server communicatively coupled with a first network and a second network, wherein the first network is a public network and the second network is a wireless communication network;

establishing a first session between the connectivity toolkit server and a network enabled device over the first network, the first session allowing access to the data storage area; and

establishing a second session between the connectivity toolkit server and a wireless communication device over the second network, the second session allowing execution of the utility programs and access to the data storage area.

25. (previously presented) The method of claim 24, further comprising authenticating a user associated with the network enabled device prior to establishing the first session.

26. (previously presented) The method of claim 25, further comprising obtaining profile information associated with the authenticated user, the profile information comprising identification of a discrete portion of the data storage area reserved for the authenticated user.

27. (previously presented) The method of claim 24, further comprising authenticating a user associated with the wireless communication device prior to establishing the second session.

28. (previously presented) The method of claim 27, further comprising obtaining profile information associated with the authenticated user, the profile information comprising an identification of a discrete portion of the data storage area reserved for the authenticated user.
